DESCRIPTION

We are developing protein-based targeted nanoparticles and nanoconjugates to selectively ablate cancer stem cells and cancer-associated fibroblasts, as well as inhibitors of immune checkpoints, to improve the current treatment of solid tumours and haematological neoplasms. We also generate immunosuppressed and immunocompetent, subcutaneous or orthotopic cancer mouse models to preclinically evaluate the anticancer effects and associated toxicities of these nanomedicines and their combinations for clinical translation and industrial transfer.

MAIN LINES OF RESEARCH

- To develop a humanised nanoconjugate of auristatin directed to leukemic stem cells for the treatment of Acute Myeloid Leukemia. Within this line, the activity of the nanoconjugate is being evaluated in new animal models derived from patient samples (PDX) and humanised murine models. We are also studying the ability of the nanoconjugate to activate the immune system and the possible synergies of its combination with other precision drugs (Casanova Rigat, Isolda).
- To design and develop protein nanodrugs for the treatment of cancer. This line seeks to offer innovative therapeutic proposals based on rational design and development of active targeted protein nanoparticles for the selective delivery of therapeutic protein domains or conjugated antitumor drugs to tumor cells (Unzueta Elorza, Ugutz).

- To develop and preclinical validation of tumor microenvironment targeted nanoparticles. This research line aims to target cancer-associated fibroblasts within solid tumors to reprogram the tumor microenvironment to reduce cancer cell aggressiveness and blocking metastatic dissemination (Alba Castellón, Lorena).
- To develop targeted nanoparticles, that incorporate bacterial toxins, to induce local tumor pyroptosis, to recruit and activate T cells in tumor and metastatic tissues, and their combination with Immune Checkpoint inhibitors and T Cell Receptor Agonists to reverse immune exhaustion, to fight microsatellite stable solid cancers (Mangues Bafalluy, Ramon).

SCIENTIFIC CHALLENGES

- To develop nanomedicines based on preclinical protocols able to achieve effective immunogenic cell death in solid tumors, which are currently resistant to Immunotherapy.
- To develop new protein nanoconjugates for targeted delivery of antitumor drugs with innovative mechanisms of action for the treatment of tumors resistant to standard drugs.
- To develop efficient protein nanovehicles for the targeted delivery of therapeutic nucleic acids to tumor cells *in vivo* as an alternative to viral vectors.
- To develop protein nanopharmaceuticals for the activation of the immune system against cancer as a more effective nano-immuno-oncology approach than current treatments.
- To develop targeted-nanotherapy to reprogram the tumor microenvironment to enhance its antitumor role.
